A. Model parameters

	Coef.	t
MA(1)	−0.707	−82.6
Seasonal MA, period 7	0.869	81.2
Seasonal MA, period 365.24	0.889	150.0

Observations: 5,114 (2012–2025)
Model: additive
Calendar: 23 time-varying regressors, removed in a first step
Outliers: 15 (critical value 6)

B. Outliers

Type	Date	Coef.	t	Event
LS	15/06/2014	−51.4	−10.0	Summer temperature
LS	01/09/2014	41.6	8.1	Summer temperature
AO	21/08/2015	−71.4	−6.5	Storm, sharp temperature drop
LS	29/08/2016	32.0	6.4	Summer temperature
LS	15/03/2020	−131.9	−24.1	Covid-19 lockdown
LS	25/04/2020	68.5	12.4	Covid-19 reopening
LS	27/07/2020	66.8	13.2	Covid-19 reopening
LS	22/08/2022	−42.4	−8.4	Energy crisis
LS	10/07/2023	75.2	10.8	Summer temperature
LS	26/07/2023	−94.1	−12.1	Summer temperature
LS	19/08/2023	53.2	8.5	Summer temperature
LS	09/07/2024	79.3	15.0	Summer temperature
LS	10/09/2024	−61.7	−11.7	Summer temperature
LS	04/06/2025	55.5	9.6	Summer temperature
LS	08/07/2025	−45.8	−7.8	Summer temperature

Notes: pre-treatment of the calendar-adjusted series (additive model, fractional airline with periods 7 and 365.2425); outlier coefficients in thousand MWh. Calendar effects are estimated in a first step with time-varying coefficients (random walks with a common variance) and removed before the outlier search. LS: level shift; AO: additive outlier. Summer temperature: level shifts, mostly in pairs of opposite sign, from temperature effects on cooling demand that are not modelled.
